01 Choose a site and enter the story

Begin with Delos and follow a complete mission from a preservation challenge to an observation report.

Opening screen: site selection, language controls and an overview of the five heritage sites.

IN THE APP

1. Open the game and select English.

2. Choose Delos and the Catastrophic level, then select Start.

3. Complete or skip the opening quiz. Read the guardian's introduction and select See the dangers.

LOOK FOR

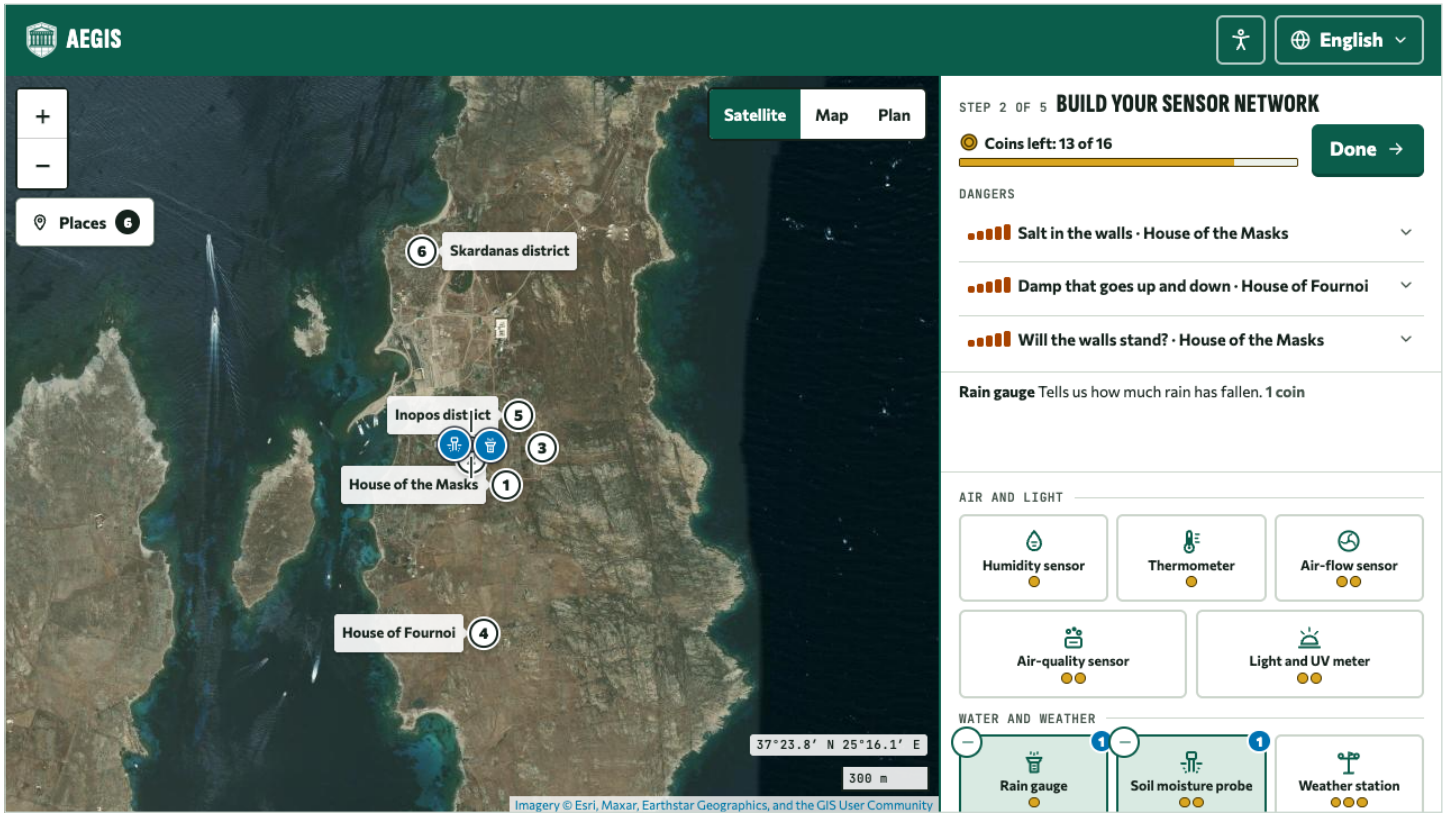

A real heritage site, its places and a mission linked to ARGUS preservation scenarios.

A REPEATABLE JURY ROUTE

Use the first mission at this level for the illustrated route. Allow around five minutes for the main sequence, then explore the interpretation and observation features. Initial guidance can be followed or dismissed using the displayed controls.

02 Design a monitoring network

Work within the virtual budget and choose sensors in response to the mission's three preservation threats.

Mission screen: three dangers, a limited budget, sensor cards and the proposed network.

IN THE APP

1. Expand the three danger descriptions and inspect the sensor cards.

2. Add a soil moisture probe and a rain gauge for the illustrated example.

3. Position the sensors using the map crosshair and add controls; drag them to adjust placement. Select Done.

LOOK FOR

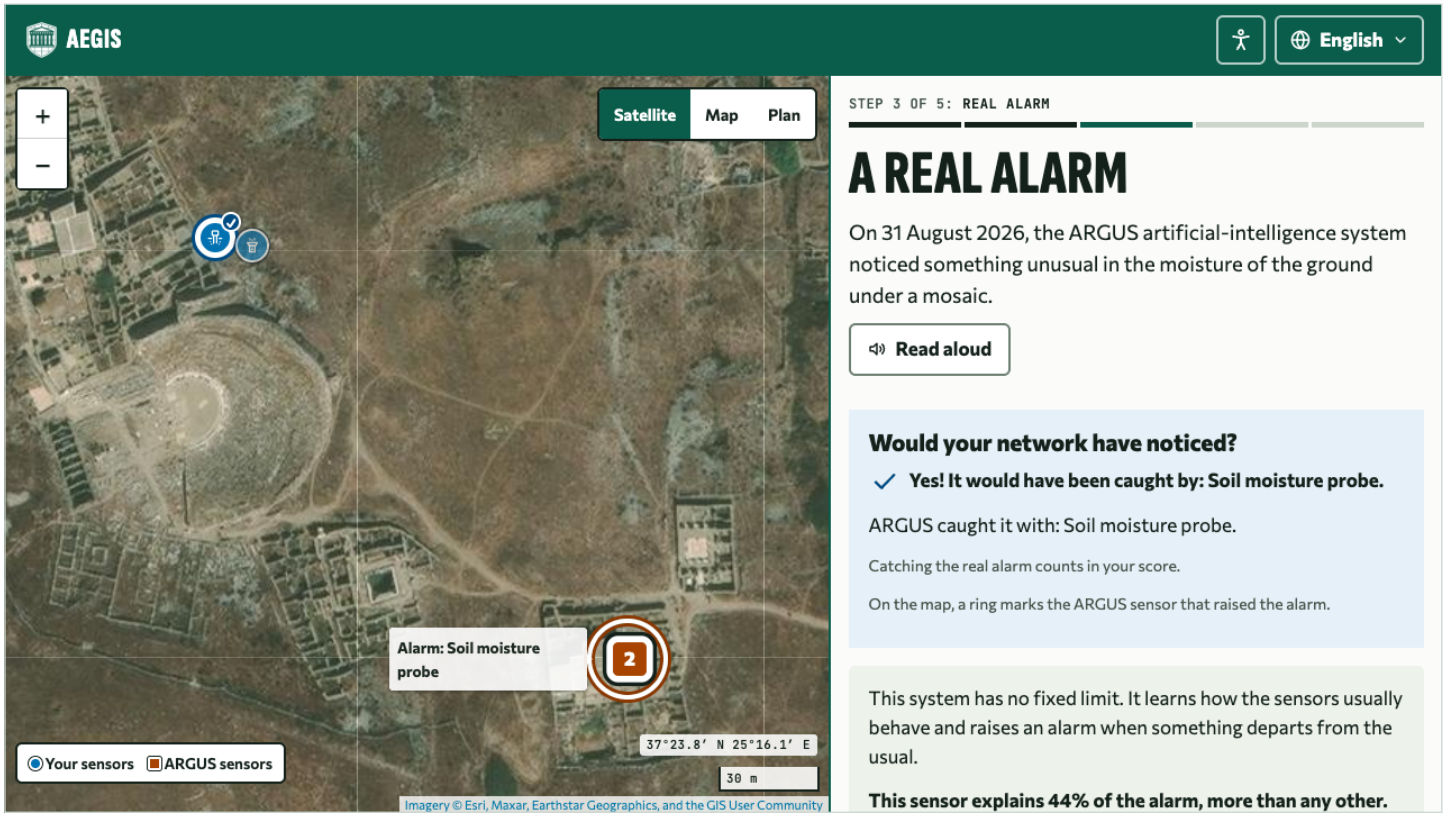

The remaining coins, selected sensor counts and blue markers update as the network changes.

READ THE CHOICES AS A DESIGN DECISION

The soil moisture probe supports detection of the recorded Delos alarm shown next. Threat coverage also depends on the other selected sensors. Sensor prices and threat-to-sensor mappings form part of the educational configuration.

03 Interpret a recorded alarm

Replay the historical event, then inspect the explanation of whether the proposed network could detect it.

Alarm explanation: source event, detected signal and feedback on the proposed network.

IN THE APP

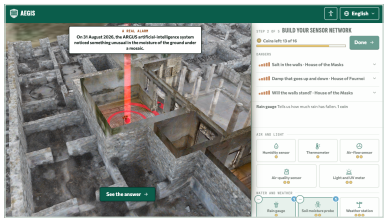

1. Watch the replay after completing the network.

2. Read the event date, principal signal and detection explanation.

3. For the illustrated Delos alarm, check the soil moisture probe result. Select Show me what ARGUS did.

LOOK FOR

The event panel connects the recorded alarm with a sensor type and shows the proposed network's detection result.

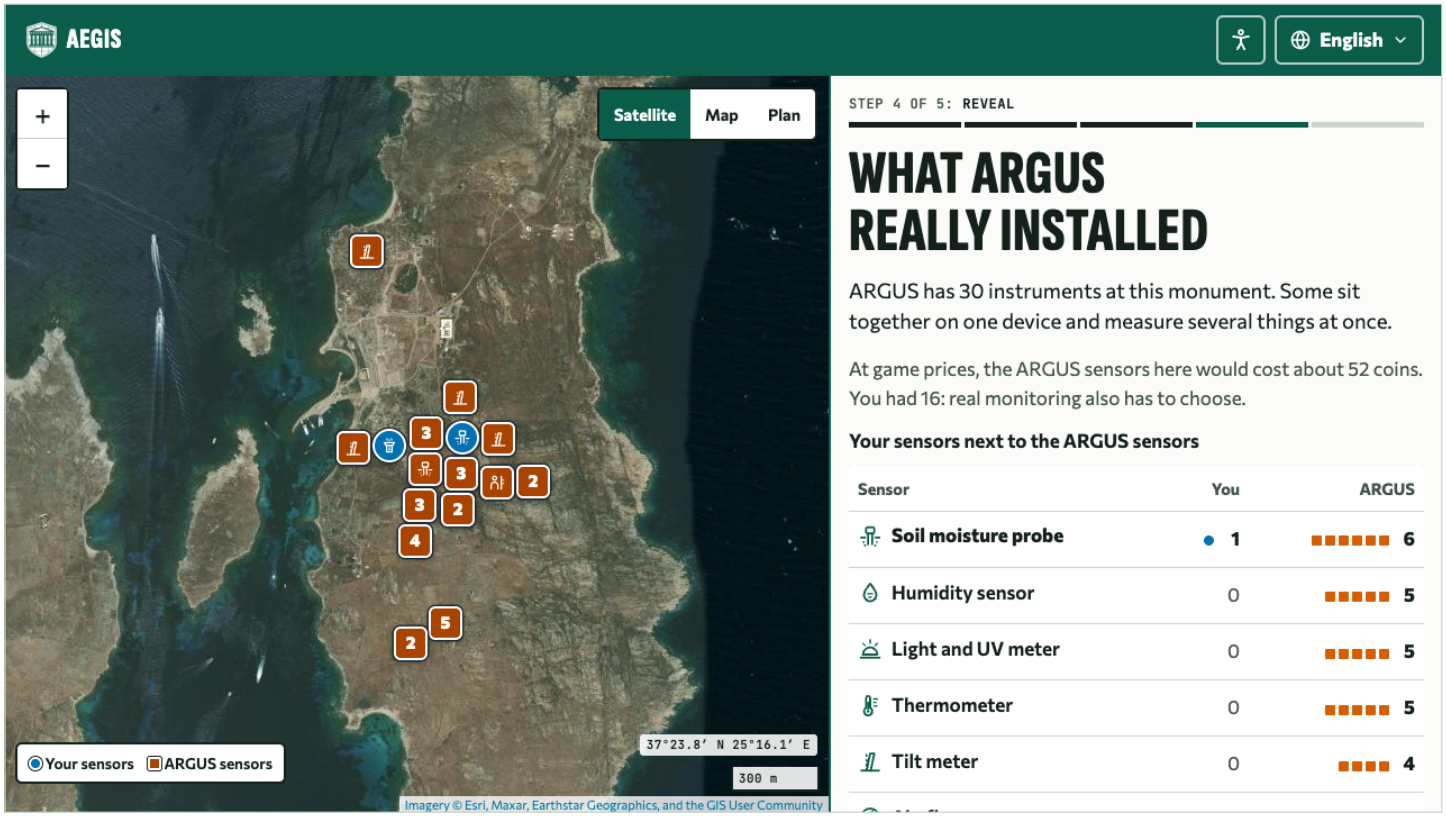

CONNECT EVIDENCE TO THE HERITAGE SITE

The illustrated event is an ARGUS AI alarm dated 31 August 2026, associated with moisture beneath a mosaic. The replay also uses the available ARGUS three-dimensional model. The result shown here follows the sensor choices in this example.

04 Compare choices with ARGUS

Inspect the installed monitoring network and use the result summary to reflect on the sensor choices.

Comparison view: the proposed network alongside ARGUS's installed instruments.

IN THE APP

1. Compare the blue player markers with the orange ARGUS markers.

2. Read the sensor-by-sensor comparison and discussion prompts.

3. Select See my score. Inspect threat coverage, alarm detection and expenditure on useful sensors.

LOOK FOR

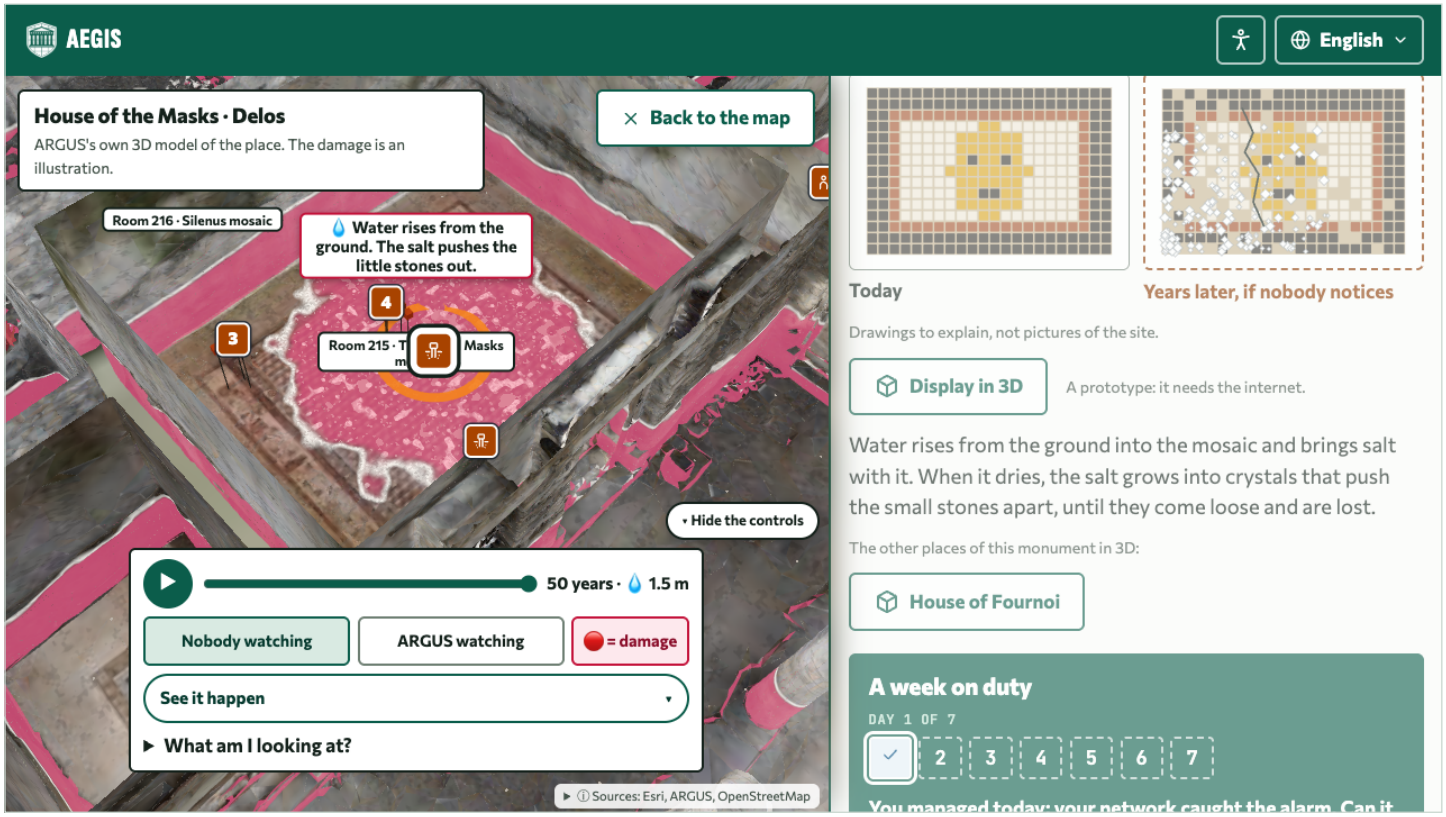

The comparison reveals the instruments actually installed at the site. The score explains the mission's applicable components.

TRY A SECOND DESIGN

Use the available network-improvement control to change a sensor choice and compare the feedback. The displayed score depends on the mission and selected cards. ARGUS's network provides a concrete reference for discussion.

05 Explore the conservation consequences

Open the available three-dimensional heritage views and examine the educational illustrations of change over time.

Heritage interpretation: the House of the Masks, its model and illustrative conservation effects.

IN THE APP

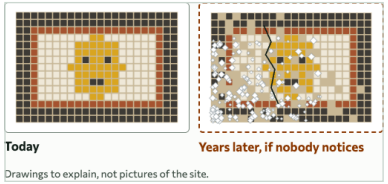

1. From the results, open the available monument or consequence view.

2. Move the years control and inspect the preservation scenarios.

3. Read the explanation of the material, location and illustrated damage. Return to the map when finished.

LOOK FOR

The three-dimensional scene and paired illustrations connect the monitoring task with the heritage fabric.

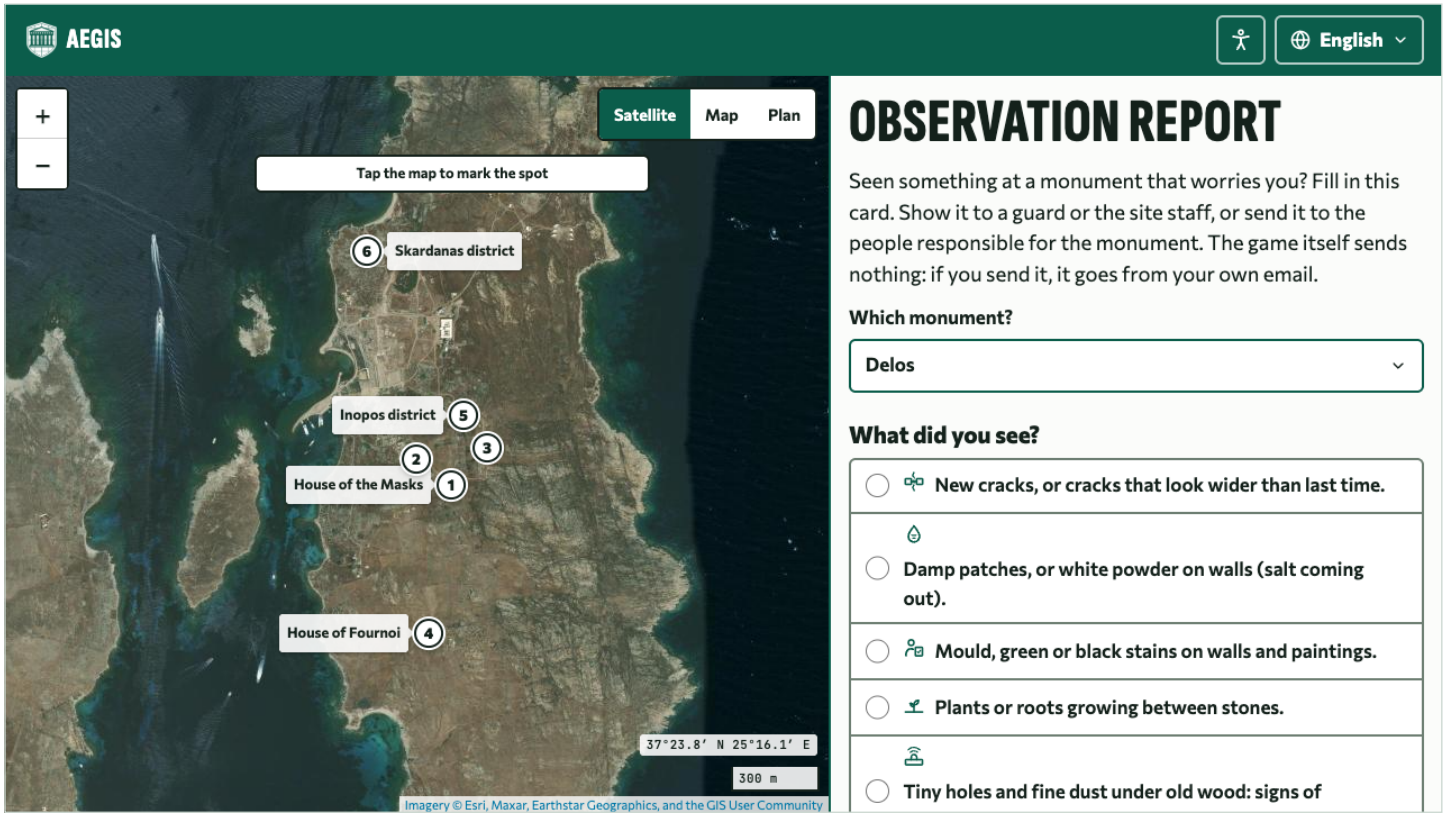

INTERPRETATION OF THE VISUAL EFFECTS

Deterioration effects are authored educational illustrations. ARGUS supplies the available site models and monitoring context. The descriptions explain how the visual effects relate to preservation concerns.

06 Record an observation

Extend the experience to a visitor's own observations through the structured reporting interface.

Observation report: site selection, observation categories and map-based location.

IN THE APP

1. Open the observation-report feature from the results or the selected site's home screen.

2. Choose the monument and select the type of observation. Add the available location and description details.

3. Review the report and its export or contact options. A sample report can be inspected locally.

LOOK FOR

The form organises a visitor's observation so it can be reviewed and communicated to the responsible site staff.

CONTINUE THE REVIEW

Play another site or level, try the mobile layout, or inspect the available quiz and classroom features. The submission also contains **AEGIS_Presentation_EN.pdf**, **AEGIS_API_Workflow.pdf**, **AEGIS_Data_Analysis.pdf** and the 2-minute 54-second gameplay video.
